

Recursion :-

①

②

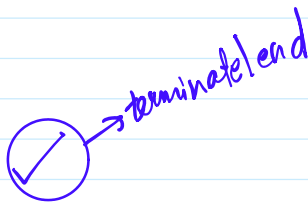

When a function calls itself until a specific is met
Base Case

3 things in recursive functions:-

- 1) Work/task (in the function)
- 2) Base Case / stopping / terminating condition
- 3) Calling recursion

```
def recursion_print(n):
    # Base Case :
    if n == 6:
        return

    print("Kairav") # Work/task
```

n=1

5 times

1. Kairav
2. Kairav
3. Kairav

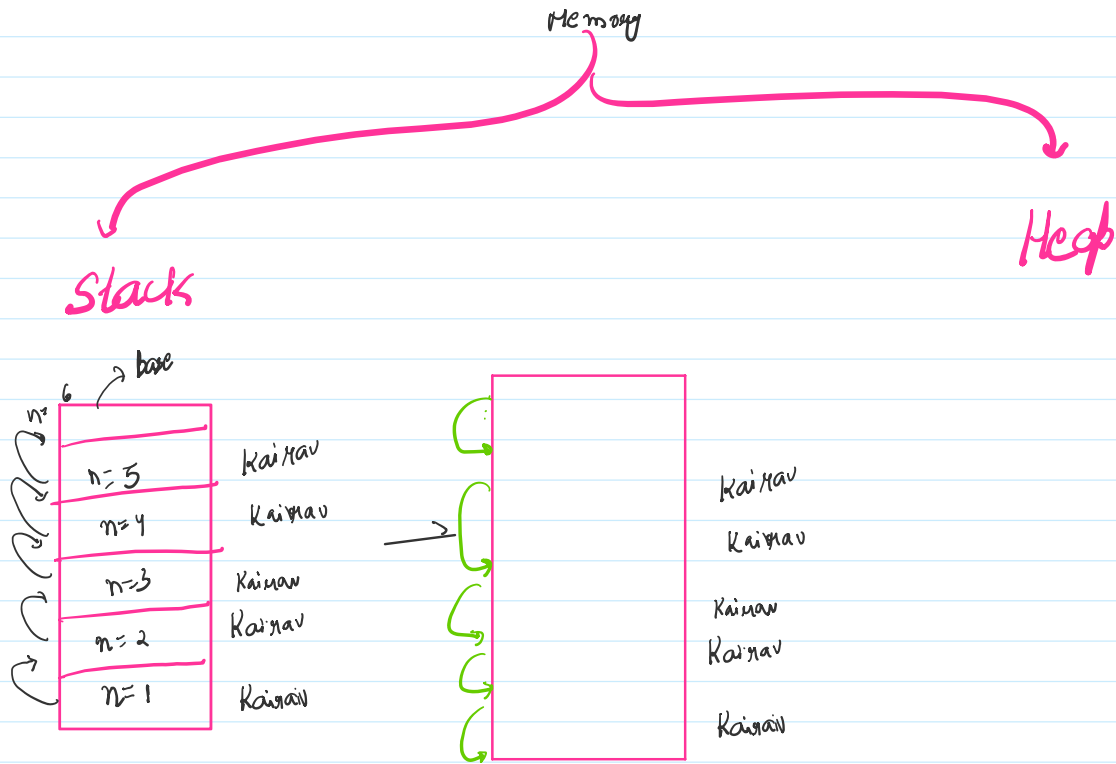

```

print("Kairav") # Work/task
recursion_print(n + 1) # Recursive call
recursion_print(1)

```

// calling a function

2. Kairav
3. Kairav
4. Kairav
5. Kairav

2) Print number from 1 to 10. using recursion

```
def print_numbers(num):
```

1. Base Case

```
if num == 11:
```

```
    return
```

2. Work

```
print(num)
```

3. Recursive call

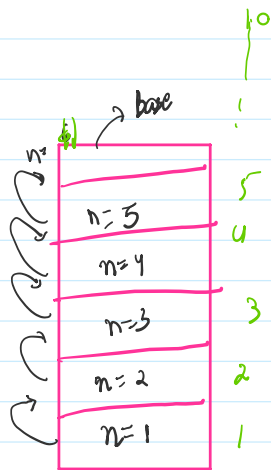

```
print_numbers(num+1)
```

```
print_numbers(1)
```

// calling
